The main idea of the project is to make an alternative option to the conventional keyboard simpler and more accessible, which will offer more or at least the same level of comfort and productivity in various aspects. Specifically, the project focuses on split and ergonomic solutions to help us avoid carpal tunnel syndrome. The implementation of the project involves simplifying the entire process of selecting a keyboard for the end user.

As part of the project, a website has been developed, with the main goal of providing information about keyboards and allowing users to view a catalog of them. The website is created using HTML, CSS, and JavaScript technologies.
